Scope of Interest

Medical Decision Making is the journal of the **Society for Medical Decision Making**. Our audience includes researchers, clinicians, and policy-makers interested in methodologic contributions to, and applications of, medical decision making. A paper does not have to be “methodologic” to be considered for publication. For example, *Medical Decision Making* is also particularly interested in exemplary applications of decision analysis, cost-effectiveness analysis, risk prediction, Bayesian statistical analysis, and other modeling techniques to clinical, public health, and management problems. MDM also has an interest in systematic reviews of methodologic literature, decision tools, and economic analyses.

We are interested in articles that develop, advance or evaluate methods or theory in clinical research, diagnosis, health economics, evidence synthesis, health policy, comparative effectiveness, informatics, health services research, judgment and decision psychology, mathematical models of diagnosis and treatment, assessment of preferences and quality of life, decision aids, risk communication, technology assessment, and statistical methods pertinent to any of these areas. Articles in one or more of these areas that are also pertinent to decision-making at any level may be suitable for this journal.

Manuscripts will be reviewed for possible publication with the understanding that they are being submitted to one journal at a time and have not been published, simultaneously submitted, or already accepted for publication elsewhere. This does not preclude consideration of a complete report that follows publication of preliminary findings elsewhere, usually in the form of an abstract or as a report.

MDM will consider manuscripts based on larger reports, such as technology assessments, comparative effectiveness reviews, NICE reports, Institute of Medicine reports, or Cochrane reviews. If you intend to submit an article based on a larger report, it is best to do so as early as possible, preferably before the larger report is published on the internet or in print.

When submitting manuscripts, authors may also submit a copy of the original research protocol, larger report, and other supplemental data as attachments if they think such materials would help the editors or reviewers better understand the work. To help the editors form a judgment about the degree of duplicate publication, please include reprints of published papers and copies of other papers in press that contain data that appear in the submitted manuscript.
